

Analytics

Who's coming to your site and what they're actually doing

Most small business owners I've worked with have no idea how their website is actually performing. They know they have one. They hope it's helping. Analytics is what turns that hope into actual data — who found you, how, and what they did next.

Sessions vs. Users

A user is a person. A session is a visit. If 50 people each visit your site twice in a week, that's 50 users and 100 sessions. The distinction matters when you're trying to figure out whether you're getting new people or the same ones coming back.

Bounce Rate

The percentage of people who landed on a page and left without doing anything else. A high bounce rate on your contact page is a problem. A high bounce rate on a blog post someone read fully and then closed — that's fine. Context matters.

Where Traffic Comes From

Google search, Instagram, a referral from another site, someone typing your URL directly — these all show up differently. Knowing which channels actually send you customers tells you where to spend your time and money.

Conversion Tracking

This is the one most people skip and then regret. A conversion is any action that matters to your business — a form fill, a phone number click, a booking. Without tracking these, you're just counting visitors instead of customers.

WHAT I SET UP

I set up Google Analytics 4 with conversion events tied to the actions that actually matter for your business. Not just pageviews — real signals.
