

Angles & Composition

How framing changes what people think without them realizing it

Where you put the camera — and where you point it — communicates things the viewer never consciously registers. Slightly below eye level reads as authoritative. Eye level reads as honest and approachable. These aren't opinions, they're consistent psychological responses to visual cues.

Rule of Thirds

Instead of putting the subject dead center, you place them at one of the intersections of an invisible 3x3 grid. The result feels more natural and dynamic. You probably already notice when photos feel "off" without knowing this is why — centering everything is usually the culprit.

Camera Height

Eye-level shots say "I'm talking to you." High angles can feel diminishing — avoid these for portraits. Low angles convey scale and confidence, which works for product shots or storefronts but can look strange for headshots.

Negative Space

Empty space in the frame isn't wasted — it gives the eye somewhere to breathe. It also gives designers a place to put text when the photo is used as a banner. A photo that's completely packed has no flexibility and often ends up with a text overlay that's impossible to read.

Leading Lines

Natural lines in your environment — a hallway, a counter edge, shelving — can be used to pull the viewer's eye toward the subject. It adds depth to what would otherwise be a flat photo of a room, and makes commercial spaces look more considered.

HOW I APPROACH IT

I plan shots with the actual web layout in mind — not just what looks good on its own, but what works as a banner, a card, a headshot. The composition decisions are made before the shutter opens.
