

Cameras & Gear

What the equipment actually does and why it matters

Gear isn't everything — but it's not nothing either. The equipment determines what's possible. A phone camera has a fixed lens, a small sensor, and no real control over depth of field. Those limitations show up the moment you try to use the photo at any real size.

The Lens Is What Actually Matters

Most people fixate on camera bodies. The lens is more important. A 50mm or 85mm prime lens is what creates that sharp subject, soft background look — that's not a filter or editing trick, it's physics. Phone cameras fake this with AI and it usually shows.

Sensor Size

A larger sensor gathers more light, which means better low-light performance and the ability to actually separate a subject from the background. This is why professional shots look dimensional instead of flat — it's the sensor doing the work, not just the editing.

Mirrorless vs. DSLR

Mirrorless is the current standard — faster autofocus, better video, and lighter. DSLRs still produce excellent images but they're the older technology. If someone's shooting your business with a DSLR, that's not a red flag, but mirrorless is where things have moved.

Lighting Gear

A single good softbox changes everything. Natural light is great when it cooperates — but it doesn't always. Controlled lighting means consistent results regardless of what the weather or your space is doing that day.

WHY THIS MATTERS FOR YOU

Phone photos look fine on Instagram. They fall apart on a homepage hero, a printed banner, or anything that gets enlarged. The gear determines how far the photos can scale.
