

SEO

Getting found on Google without running ads

SEO has a reputation for being mysterious and expensive. It's neither. At the small business level, most of the wins come from getting the basics right — things a lot of developers skip because they're not thinking about search, just about shipping the site.

On-Page Basics

Every page on your site should have a title tag, a meta description, and a clear heading structure. These aren't optional extras — they're how Google figures out what your page is about and decides whether to show it to someone searching for what you do.

Technical SEO

If your site loads slow, doesn't work on mobile, or has broken links, Google notices. These aren't stylistic issues — they directly affect how high you rank. A site that's technically clean has a head start before content even comes into play.

Local SEO

If you serve customers in a specific area, local SEO is where most of your wins will come from. Your Google Business Profile, consistent business info across the web, and location-specific pages are what put you in front of people searching nearby.

Backlinks

Other websites linking to yours is still one of the strongest ranking signals Google uses. You don't need hundreds — a handful of relevant local links (chamber of commerce, local directories, press) can move the needle significantly for a small business.

WHAT I BUILD IN FROM DAY ONE

I build in proper heading structure, descriptive title tags, mobile-first code, fast load times, and a Google Business Profile walkthrough from day one. The stuff that compounds over time.
